3: Harrisson N-5 (1934-1935) 1936
0012 Malekula 0012
B.S Nambas

but there is a big range of inter-tribal difference; take several islands and the variety is great. Curved houses seem to be found only in south Malekula, Ureparapara of the Banks (*cf.* Speiser, 1913, Pl. 15), and the southern islands of the group, an extraordinary distribution. To understand the development and organization of the village only structurally, a full study of each particular unit is necessary.

Speiser (1913) has said something of the distribution of stone works. Stone pudding-basins are confined to Big Bay. I was interested in stone axes, of which I made a considerable collection. Remarkable stone basins, "witching-vats," are confined to Gaua, where Mrs. Baker and I also found a stone effigy (Baker, 1935). In one small area of south-west Santo, around the village of Tavua, the stone axes are entirely distinct from all others in the group, being very slender and long in relation to their breadth. Shell axes do not occur in Santo, but are common in Malekula; in the Big Nambas there are some ritual clubs that seem to be made out of fossilized squid's cuttles, very long and heavy.

War-clubs are curved only in north-east Santo; long stick clubs are confined to the northern islands; paddle clubs characteristic of Malekula are absent on Santo. The Santo and Malo bows are regularly arched; in south and east Malekula the concavity is uneven, greater in the lower half. Feathered spear shafts are apparently confined to north Malekula and islets; fearful spear-tips of serried human bones only in Santo. Feather-shafted arrows I have not seen in Santo, but Speiser reports them from Big Bay, and there are two without locality in the Cambridge Ethnological Museum; in certain *na-leng* dances of north Malekula, feathered arrows are used. Combs worn in the hair show wide pattern range; a triangular form I have only seen on Gaua, and ones with handles decorated by pigs' bristles are confined to Sakau, Santo.

The distribution of *kava* is curious. It has a very local usage in north Malekula, where it is chewed and spat into a trough; is not used in south Malekula; in Sakau, Santo, the stalk is chewed; elsewhere in Santo the root is chewed and spat out into coconut shells (only by chiefs in part of the north-west), except around Turi, where it is absent. In the eastern islands *kava* is generally used green, crushed with a stone pounder. On Malo it is seldom used unless in magical rites.

There is a fair uniformity in the type of mixed bisexual dances connected with the graded society; the musical instruments vary more. Pan-pipes are the most important in north-west Santo; though widespread, these are seldom used for dances elsewhere; they are semi-sacred in central Malekula; into Sakau and Malekula the pan-pipes have been recently introduced. On Malo and in east Santo bamboos beaten on the ground are the main dance accompaniment; the former type is close to a large flute figured by Speiser (1913, Pl. 108). The nose-flute is used in Sakau; musical bow in central-south Malekula. Slit gongs are always upright in the patrilineal central islands, reclined in the northern islands. Sticks tapped together have developed into a dance band in the Big Nambas. Bone knives are common in south Malekula, but nowhere else have I found one; wooden knives are absent in Malekula, crude in Malo and W. Santo, elaborate in the Banks Islands.
